

CLAIMS:

Sub A1
5
1. Arrangement for reproducing a multimedia signal comprises presenting means for presenting the multimedia signal to a user, characterized in that the arrangement station comprises delay determining means for determining a delay measure representing the arrival delay of packets carrying the multimedia signal, and in that the presenting means are arranged for varying the presentation speed in dependence on said delay measure.

Sub B1
10
2. Arrangement according to claim 1, characterized in that the multimedia signal comprises an audio signal, and in that the presenting means are arranged for varying the presenting speed of the audio signal without substantially changing a perceived intonation of the audio signal.

Sub C1
15
3. Arrangement according to claim 2, characterized in that the audio signal is represented by a plurality of segments comprising a plurality of signals being described by at least their amplitude and frequency, and in that the presenting means are arranged for changing the duration of said segments in dependence on said delay measure.

20
4. Arrangement according to claim 1, characterized in that the presentation means comprise control means having comparison means for determining a difference signal representing a difference between the delay measure and a reference value, and in that the presentation means comprises adjusting means for adjusting the presenting speed in dependence on the difference value.

Sub D1
25
5. Arrangement according to claim 4, characterized in that the presentation means comprises adaptation means for adapting the reference value in dependence on the variations of the difference value.

6. Arrangement according to claim 1, characterized in that the multimedia signal comprises a video signal.

7. Arrangement according to claim 6, characterized in that the video signal is represented by a at least one object, and in that the presentation means are arranged for varying the presentation speed by adjusting a movement speed of at least one object in the video signal.

8. Arrangement according to claim 1, characterized in that the multimedia signal comprises at least two components, in that the delay measure represents a timing difference between said at least two components, and in that the presentation means are arranged for varying the presentation speed in order to reduce said timing difference.

9. Method for reproducing a multimedia signal, said method comprises presenting the multimedia signal to a user, characterized in that the method further comprises determining a delay measure representing an arrival delay of packets carrying the multimedia signal, and in that the method comprises changing the presentation speed in dependence on said delay measure.

10. Method according to claim 9, characterized in that the multimedia signal comprises an audio signal, and in that the method comprises varying the presenting speed of the audio signal without substantially changing a perceived intonation of the audio signal.

11. Method according to claim 210, characterized in that the audio signal is represented by a plurality of segments comprising a plurality of waveforms being described by at least their amplitude and frequency, and in that the method comprises changing the duration of said segments in dependence on said delay measure.

12. Method according to claim 9, characterized in that the multimedia signal comprises a video signal.

13. Method according to claim 212, characterized in that the video signal is represented by a at least one object, and in that the method comprises varying the presentation speed by adjusting a movement speed of at least one object in the video signal.
